

终结符如下

符号	对应终结符	符号	对应终结符	符号	对应终结符
++ -- ! ~ + -	ω_0	* / %	ω_1	+ -	ω_2
<< >>	ω_3	< <= > >=	ω_4	== !=	ω_5
= -= += ... ^=	ω_6		" "	&&	'&&'
	" "	^	"^"	&	"&"
("(")	")"	;	";"
常数	c	变量	v	字符串	s

实现的运算符按照优先级表示如下所示：

运算符	描述
++ -- ! ~ + -	一元运算符
* / %	乘除法运算符
+ -	加减法运算符
<< >>	移位运算符
< <= > >=	关系运算符
== !=	相等运算符
&	位与运算符
^	位异或运算符
	位或运算符
&&	逻辑与运算符
	逻辑或运算符
= -= += *= /= %= &= ^= = <<= >>=	赋值运算符

按照上述运算符优先级实现了表达式文法，C语言的运算表达式文法如下所示：

```
Start -> Expressions
Expressions -> Assignment_expression ";" Expressions | "ε"
Assignment_expression -> Assignment_expression  $\omega_6$  logic_or_expression
| logic_or_expression
logic_or_expression -> logic_or_expression '||' logic_and_expression | logic_and_expression
logic_and_expression -> logic_and_expression "&&" or_expression | or_expression
or_expression -> or_expression '|' xor_expression | xor_expression
```

$\text{xor_expression} \rightarrow \text{xor_expression } \wedge \text{ and_expression } \mid \text{ and_expression}$
 $\text{and_expression} \rightarrow \text{and_expression } \& \text{ equal_expression } \mid \text{ equal_expression}$
 $\text{equal_expression} \rightarrow \text{equal_expression } \omega_5 \text{ relation_expression } \mid \text{ relation_expression}$
 $\text{relation_expression} \rightarrow \text{relation_expression } \omega_4 \text{ shift_expression } \mid \text{ shift_expression}$
 $\text{shift_expression} \rightarrow \text{shift_expression } \omega_3 \text{ add_expression } \mid \text{ add_expression}$
 $\text{add_expression} \rightarrow \text{add_expression } \omega_2 \text{ mul_expression } \mid \text{ mul_expression}$
 $\text{mul_expression} \rightarrow \text{mul_expression } \omega_1 \text{ unary_expression } \mid \text{ unary_expression}$
 $\text{unary_expression} \rightarrow \omega_0 \text{ T } \mid \text{ T}$
 $\text{T} \rightarrow c \mid v \mid s \mid (\mid \text{ Assignment_expression })$

将上述的文法转换成LL(1)文法后，结果如下所示：

我们使用缩写将上述文法中的非终结符表示出来，其中{}内的内容表示select集，{}后的内容表示文法的编号

将 $\{c\}$, $\{v\}$, $\{s\}$ 看作同一种类型的内容，记为 obj ，因此有LL(1)分析表如下
